Slide 2

Objectives

- 1) Learn about the sources of variability in clinical pharmacology
- 2) Appreciate how a target concentration (TC) strategy is essential for rational drug development and clinical use
- 3) Distinguish target concentration intervention (TCI) from therapeutic drug monitoring (TDM)
- 4) Understand how to make rational choices for dose individualization

©NHG Holford, 2021, all rights reserved.

Slide 3

PK = Pharmacokinetics: What the body does to the drug
PD=Pharmacodynamics: What the drug does to the body
RX=Treatment: What the prescribed and patient need to know.

Dose

Concentration

Effect

©NHG Holford, 2021, all rights reserved.

Clinical pharmacology describes the effects of drugs in humans. One way to think about the scope of clinical pharmacology is to understand the factors linking dose to effect.

Drug concentration is not as easily observable as doses and effects. It is believed to be the linking factor that explains the time course of effects after a drug dose.

The science linking dose and concentration is pharmacokinetics. The two main pharmacokinetic properties of a drug are clearance (CL) and volume of distribution (V).

The science linking concentration and effect is pharmacodynamics. The two main pharmacodynamic properties of a drug are the maximum effect (E_{max}) and the concentration producing 50% of the maximum effect (C₅₀).

Slide
6

Target Concentration Drug Development and Clinical Use

- Effective drug development needs a plan
 - » A good plan has a clear objective
 - » TC provides a clear objective in all phases of drug development

- TC is the rational basis for dose individualization
 - » Choose the target effect to determine the TC
 - » Use TC to predict individual dose

Holford NHG. The target concentration approach to clinical drug development. Clin Pharmacokinet. 1995;29(5):287-91.

©NHG Holford, 2021, all rights reserved.

Slide 7

Target Concentration in Drug Development

The 1992 view was based on using PKPD for drug development but did not explicitly include how to use medicines in patients.

Slide 8

Target Concentration in Clinical Use of Medicines

$$\text{Target Conc} = \text{Target Effect} \times \text{C50} / (\text{Emax} - \text{Target Effect})$$

Target Conc	Dose Model
Initial Peak	Loading Dose = Target Conc x Volume of Distribution
Average Steady State	Maintenance Dose Rate = Target Conc x Clearance

Ideal dose prediction requires **individual** estimates of **Emax, C50, V and CL**

The target concentration approach links PKPD to prediction of the right dose for a patient.

If Emax and C50 and Target Effect are not known then the Target Conc may be estimated from:

$$\text{Daily Dose} = \frac{\text{Typical Average Target Conc} \times \text{Clearance}}{\text{Typical}}$$

Slide 9

TDM or TCI?

- Therapeutic Drug Monitoring
 - TDM Therapeutic Range

Imprecise

- Sub-optimal at borders of the range

- Target Concentration Intervention
 - TCI Single Target

Accurate

- Optimal – do the best you can

<p>Slide 10</p>	<h2 style="text-align: center;">Why TDM Cannot Work</h2> <ul style="list-style-type: none"> ➤ TDM proposes a range of concentrations to judge if an individual is getting the right dose ➤ It is not reasonable to prescribe a range of doses in order to match the range of concentrations ➤ Therefore the therapeutic window cannot be used to get the right dose ➤ There is only one dose that can achieve the target concentration that will produce the target effect <p style="font-size: small;">©EHG Hofford, 2021, all rights reserved.</p>

Slide 21

Dosing Individualization Method Depends on SEV

Suppose $PPV_{total}=0.7$, $BSV_U=0.4$, $WSV_U=0.3$
 $PPV_U=\sqrt{BSV_U^2 + WSV_U^2}=0.5$ $BSV_P=\sqrt{PPV_{total}^2 - BSV_U^2}=0.57$

SEV	Method Criteria	Example	Dosing Strategy
0.9	$SEV > PPV_{total}$	$0.9 > 0.7$	Population dosing
0.55	$PPV_{total} > SEV$ $SEV > PPV_U$	$0.7 > 0.55$ $0.55 > 0.5$	Group dosing (WT, CLcr, etc) ($BSV_P \rightarrow 0$)
0.35	$PPV_U > SEV$ $SEV > WSV_U$	$0.5 > 0.35$ $0.35 > 0.3$	Individual response dosing (TCI) ($BSV_U \rightarrow 0$)

Note: If $SEV < WSV_U$ then medicine cannot be used safely

Holford NHG, Buclin TMD. Safe and effective variability - A criterion for dose individualization. Ther Drug Monit 2012; 34: 565-68

Slide 22

Safe and Effective Variability (SEV) Aminoglycosides

PPV_U	BSV_U	WSV_U
0.33	0.30	0.13

- Suggested Therapeutic Success Criterion
 - 90% of Concs Within 80%-125% of Target C_{ss}
 - ∴ SEV is 0.136 (log normal SD)
- Unpredictable PPV_U is 0.33 and is $> SEV$
 - ∴ Covariate (WT, CLcr) prediction alone will be inadequate
- Unpredictable WSV_U is 0.13 and is $< SEV$ (just!)
 - ∴ TCI can achieve safe and effective target

Slide 23

Which Way to Aim?

- Phase 2 Drug Development
 - » PK and PKPD relationships (Target Effect \rightarrow Target Conc)
 - » Predictable and Unpredictable variability (PPV_T)
 - » Between (BSV_U) and within subject (WSV_U)
- Phase 3 Drug Development
 - » Safe and effective variability (SEV)
 - » The BIG difficulty is deciding on SEV !
- Clinical Use of Medicines
 - » Use quantitative criteria to decide on dosing method
 - » Covariate Dosing if $PPV_T > SEV > PPV_U$
 - » TCI Dosing if $PPV_U > SEV > WSV_U$

©NHG Holford, 2021, all rights reserved.

Slide 24

The target for PKPD is improving patient outcome by developing medicines which can achieve the target effect

Slide 25

Why TCI?

Clin. Pharmacokinet. 25 (6): 495-505, 1993

Theophylline Target Concentration in Severe Airways Obstruction – 10 or 20 mg/L?
A Randomised Concentration-Controlled Trial

Nicholas Holford¹, Peter Black¹, Ron Couchl², Julia Kennedy³ and Robin Briant¹

1 Department of Pharmacology and Clinical Pharmacology, School of Medicine, University of Auckland, Auckland, New Zealand

2 Department of Clinical Chemistry, Auckland Hospital, Auckland, New Zealand

3 Department of Pharmacy, School of Medicine, University of Otago, Dunedin, New Zealand

- How can a target concentration of 10 mg/L be achieved and maintained?

©NHG Holford, 2021, all rights reserved.

Slide 26

Which Drugs for TCI?

1. Effect is hard to measure (drug is working when the response is not observable)
 - » Anti-arrhythmics e.g. lignocaine
 - » Anti-convulsants e.g. phenytoin
 - » Anti-coagulants e.g. warfarin
2. Big unpredictable variability (using weight, renal function, etc) and small within subject variability
 - » Too much variability means either inadequate beneficial effect or too much adverse effect
 - » Observing patient response can predict future dose needs

©NHG Holford, 2021, all rights reserved.

The first reason for using TCI uses a response, such as BP, as a substitute for being able to measure the clinical disease state that is being treated. When the medicine is working well or it is not working at all the clinical disease state may appear to be the same. It is assumed that trying to reach a typical response that is usually associated with benefit is better than giving everyone the same dose.

The second reason for using TCI is when group based dosing (e.g. using weight) is not enough to reduce the between subject variability so that the medicine can be used safely and effectively. TCI can only work however if the within subject variability (that cannot be influenced by TCI) is small enough so that dose individualization is really predictive for future use of the medicine in the same patient.

Slide 27

How? Target Concentration Strategy

1. Choose Target Concentration
2. Determine V and CL using WT etc.
3. Calculate LD and MDR
4. Measure Response (e.g. INR)
Revise Target Conc
5. Measure Concs
Revise V and CL
6. Goto Step 3

©NHG Holford, 2021, all rights reserved.

The target concentration strategy is an algorithm for reaching the best individual dose. It starts with choosing a target concentration based on pharmacodynamic studies. A group value for volume (V) and or clearance (CL) can be determined before the medicine is given. These PK parameters are then used to calculate the initial loading dose (LD) and maintenance dose rate (MDR). A response is measured reflecting how the individual is different from the group of patients who are otherwise similar in weight, genotype, etc. If the response is a measure of drug effect e.g. INR, then it can be used to revise the target conc. If the response is a concentration then it can be used to revise V and CL. Most commonly the focus will be on CL so that a new individualized maintenance dose rate can be calculated.

Slide 28

Target Concentrations

Target Concentrations and Pharmacokinetic Parameters for Selected Medicines (70 kg standard individual). C_{ss} is the average steady state concentration.

Drug	Target Conc	Clearance	Volume of distribution
Aminoglycosides	Peak 20 mg/L* C _{ss} 3 mg/L	6 L/h	18 L
Cyclosporin**	150 ng/mL	17 L/h	245 L
Phenytoin	10 mg/L	V _{max} =415 mg/d, K _m =4mg/L	45 L
Digoxin	2 ng/mL	9 L/h	500 L
Theophylline	10 mg/L	3 L/h	35 L

* 24 hour dosing ** whole blood

©NHG Holford, 2021, all rights reserved.

Target concentrations and PK parameters are known for most medicines which are helped by TCI.

Slide 29

Target Effects

Target Effects and Pharmacodynamic Parameters for Selected Medicines. E_{max} is the maximum effect due to the drug, EC₅₀ is the concentration producing 50% of E_{max}. PEF_R is peak expiratory flow rate.

Drug	Target Effect	E _{max}	EC ₅₀
Aminoglycosides	"cure"	?	?
Cyclosporine	"prevention of rejection"	?	?
Phenytoin	"prevention of seizures"	?	?
Digoxin	"control of atrial fibrillation"	?	?
Theophylline	"normal PEF _R "	344 L/min	11 mg/L
Warfarin	INR 2-3	100% *	1.5 mg/L

- Inhibition of prothrombin complex synthesis

©NHG Holford, 2021, all rights reserved.

The pharmacodynamic parameters for medicines that use TCI are typically not well known. This is a reflection of the difficulty of measuring a clinical response that can be related to concentration.

Holford NHG, Black P, Briant R, Couch R, Kennedy J.

Slide 30

Determine Group V and CL

- Volume of Distribution
 - » size $V = V_{pop} \times WT/WT_{std}$
 - » body composition
- Clearance
 - » size $CL = Cl_{pop} \times (WT/WT_{std})^{3/4}$
 - » renal function
 - » hepatic function
 - » concomitant drugs

©NHG Holland, 2021, all rights reserved.

WT=patient weight
WTstd=standard weight e.g. 70 kg
Vpop, CLpop=population volume and clearance in a standard subject e.g. 70 kg.

Slide 31

Calculate LD and MDR e.g. gentamicin

- LD = TC x V
= 20 mg/L x 20 L = 400 mg
- MDR = TC x CL
= 3 mg/L x 6 L/h = 18 mg/h

©NHG Holland, 2021, all rights reserved.

Slide 32

When to Measure Concs?

Goal is to estimate PK e.g. CL

- Number of Samples
 - » Most medicines 1
 - » Gentamicin 2
- Timing of Sample
 - » Most medicines Middle of dosing interval
 - » Gentamicin "peak" and "trough"

©NHG Holland, 2021, all rights reserved.

A rational approach to measuring drug concentrations is based on using the measurement to predict pharmacokinetic parameters – most commonly clearance. The least informative time to measure concentrations is just before the next dose (the 'trough' concentration) unless this is paired with another 'peak' concentration. This is because clearance determines the average concentration. So measuring a concentration in the middle of the dosing interval will be closer to the average and therefore more useful for predicting clearance. Gentamicin concentrations vary widely in a dosing interval so two concentrations are needed to reliably estimate clearance.

Slide 33

When to Measure Concs?

Goal is to estimate PK e.g. CL

- Number of Samples
 - » Most medicines 1
 - » Gentamicin 2
- Timing of Sample
 - » Most medicines Middle of dosing interval
 - » Gentamicin “peak” and “trough”

©NHG Hofford, 2021, all rights reserved.

A rational approach to measuring drug concentrations is based on using the measurement to predict pharmacokinetic parameters – most commonly clearance. The least informative time to measure concentrations is just before the next dose (the ‘trough’ concentration) unless this is paired with another ‘peak’ concentration. This is because clearance determines the average concentration. So measuring a concentration in the middle of the dosing interval will be closer to the average and therefore more useful for predicting clearance. Gentamicin concentrations vary widely in a dosing interval so two concentrations are needed to reliably estimate clearance.

Slide 34

Digoxin

Tmid = middle of dosing interval

©NHG Hofford, 2021, all rights reserved.

A concentration in the middle of the dosing interval (C_{tmid}) will be closer to the average steady state concentration (C_{ss}) than either a peak or trough concentration. Clearance is easily calculated from $CL = \text{DoseRate} / C_{ss}$ which can be approximated by $CL = \text{DoseRate} / C_{tmid}$.

Slide 35

Gentamicin TDS

©NHG Hofford, 2021, all rights reserved.

Slide
36

Gentamicin concentrations with once a day dosing vary considerably. The trough concentration at 24 h is often unmeasurable because it is below the limit of quantitation. Concentrations are best measured 1h and 8 h after the dose.
